DARPA and the Brain Initiative

Development of Intelligence. Understanding the development of intelligence in a human infant is a key project of CBMM. This project engages the fundamental tradeoff between nature and nurture, or priors and data, and ultimately the origin of priors—how constraints are selected by evolution, encoded in genes, and instantiated in genetically wired brain circuits.

Developing ultra high bandwidth brain-machine interfaces to connect humans and computers. Neuralink. Learn more. We've scaled neural recording and stimulation to thousands of channels, providing a clearer picture of activity in the brain. Watch the launch ...

### The development of brain-machine interface neuroprosthetic ...

From birth to age 5, a child's brain develops more, and more rapidly, than at any other time in life. The quality of a child's experiences in the first few years of life helps shape brain development and has a lasting impact on their health and ability to learn and succeed in school and in life.

A brain-computer interface (BCI), sometimes called a neural-control interface (NCI), mind-machine interface (MMI), direct neural interface (DNI), or brain-machine interface (BMI), is a direct communication pathway between an enhanced or wired brain and an external device. BCI differs from neuromodulation in that it allows for bidirectional information flow.
